GENERAL INFORMATION:

APPLICANT: Rainar, Raiesh

APPLICANT: Sahni, Girish

APPLICANT: Sahni, Girish

APPLICANT: Rajagopal, Kammara

APPLICANT: Rajagopal, Kammara

APPLICANT: Nahalari, Deepak

APPLICANT: Nahalari, Deepak

APPLICANT: Nadavim Vasudha

APPLICANT: Nadavim NOVEL CLOT-SPECIFIC STREPTOKINASE

TITLE OF INVENTION: PROTEINS POSSESSING ALTERED PLASMINOGEN ACTIVATION

TITLE OF INVENTION: PROTEINS

TITLE OF INVENTION: CHARACTERISTICS AND A PROCESS FOR THE PREPARATION OF SAID

TITLE OF INVENTION: CHARACTERISTICS AND A PROCESS FOR THE PREPARATION

TITLE OF INVENTION: US/10/631,558

CURRENT FILING DATE: 2003-07-31

PRIOR APPLICATION NUMBER: US/09/940,235

PRIOR APPLICATION NUMBER: US/09/940,235

PRIOR FILING DATE: 1999-12-24

** NUMBER: OF SEQ ID NOS: 28

** SOFTWARE: FRAESEQ for Windows Version 4.0

SEQ ID NO 2

LENGTH: 414

TWOS: DATE: 1919
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       APPLICANT: Zhang, Xuejun C

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antiatherosclerotic, vasotropic, immunosuppressive, anti-HNO described as antiatherosclerotic, vasotropic, immunosuppressive, anti-HNO described as antiulcer, antibacterial and antiparasitic. Peptides of the invention antiulcer, antibacterial and antiparasitic. Peptides of the invention antiulcer, antibacterial and antiparasitic. Peptides of the invention comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Altoeimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. arthitis, inflammatory joint cancer, inflammatory disorders (e.g. arthitis, inflammatory joint disorders), cardiovascular diseases (e.g. heart failure, atherosclerosis and myocardial repertusion injury), immune diseases (e.g. heart failure, anterimine), systemic lupus erythematosus, diabetees mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, croph, s diseases including bacteria, parasite, prion-based diseases, and accelerated aging. The current sequence repersents a streptokinase defined derived peptide of the invention with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptokinase, cell death, apoptosis, necrosis, nootropic, neuroprotective, antiparkinsonian, anticonvulsant; cytostatic; antiinflammatory; antiarthritic; antifrhematic; cardiant; antiatherosclerotic; vasotropic; immunosuppressive; anti-HIV; dermatological; antidabetic; antibaressive; anti-HIV; antiulcer; antibacterial, antiparastitc; neurodegenerative disease; Parkinson's disease; Alzheimer's disease; Huntington's disease; Parkinson's disease; Alzheimer's disease; Huntington's disease; Mricardiovascular degeneration; neoplastic disease; Huntington's disease; morazdiovascular disease; arthritis; inflammatory joint disorders; arthritis; inflammatory joint disease; morazdiovascular repertusion injury; immune disease; autoimmune disease; acquired immunodeficiency syndrome; AlDS; rheumatoid arthritis; systemic lupus erythematosus; diabetes mellitus; pernicious anaemia; mellitus; penciative diseases; ulcerative colitis; pancreatitis;

peptides or the invention may be described as, nootropic, antinflammatory, antiparkingonian, anticonvulsant, cytostatic, antinflammatory, antiparkingonian, anticonvulsant, cytostatic, antinflammatory, antiparkingonic, immunosuppressive, anti-HIV.

Comprision antibacterial and antiparasitic. Peptides of the invention are useful for treating comprising peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. parkinson's, Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. parkinson's, Alzheimer's, Huntington's disease, andiovascular diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune construint in particious and myocardial reperfusion injury), immune diseases (e.g. autoimmune construint in the current sequence represents a streptokinase construint construint in the current sequence construints in the current sequence construints construints in the current construints in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic,
                                                                                                                                                                                                                                           New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 7; Column 12; 15pp; English.

AMY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

nucleic acids may be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

and any other organ), viral disorders (e.g. hepatitis, retroviral

infections, viral encephalitis, and AIDS/HIV), neurodegenerative

disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

clerosis (FALS)), cardiovascular disease (e.g. atherosclerosis

myocardial infarction, heart failure, cardiomyopathy, myocardial

repertrusion injury, and hypertensive heart disease), immune disease (e.g.

repertrusion injury, and hypertensive heart disease), immune disease (e.g.

rheumatoid arthritis, systemic lupus erythematocous, insulin-dependent,
diabetes mellitus, lupus, pernicious anaemia, dermatomyositis, enythema

nodosum, Sjogrem's syndrome, temporal arthritis, myasthenia gravis,

Wegener's granulomatosis, glomerulonephitis, anti-phospholipid syndrome,
and autoimmune polyarthritides), a neopplastic disorder (e.g. leukemia,
arcomas, myelomas, carcinomas, neuromas, melanoma, cancers of the

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antiantentic, antiinchematic, cardiant, chematory, antiparkinsonian, anticonvulsant, cytostatic, antiantentic, antiincentic, anticipactic, immunosuppressive, anti-HIV, dermatological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiating peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. parkinson's Alzheimer's Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. nerthitis, inflammatory joint disorders), cardiovascular diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune systemic lupus erythematosus, diabetes mellitus, permicious anaemia), myolodegenerative diseases, viral diseases, and degenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, conducederated aging. The current sequence represents a streptokinase of derived peptide of the invention with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             death in cardiac myocytes

The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliozating cell death, its derivative or analogue, comprising a sequence Val-Asp-Val, where the peptide is in a suitable pharmaceutical camposition.

Comprising the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's disease and Alzheimer's disease; cardiovaccular disease e.g. AIDS and therosclerosis and myocardial infarction; immune disease e.g. AIDS and therosclerosis and myocardial infarction; immune disease e.g. AIDS and inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and severe shock; inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and spinal cord control insult e.g. inver toxicity; and pulmonary toxicity; spinal cord disease e.g. motor neuron disease and duillain-Bare syndemic procedures associated with cell death e.g. bypass surgery and infectious disease e.g. hepatitis and viral encephalitis; crohn's disease; ulcertaive colitis; accelerated aging and oxidative stress in a warmblooded animal. The present sequence represents the amino acid sequence of a 20mer peptide capable of ameliorating cell death which is based on a construction or a capable of ameliorating cell death which is based on a Pharmaceutical composition for treating e.g. neurodegenerative disorder, cardiovascular disease, neoplastic disorder, viral disease and immune diseases, comprises a peptide capable of ameliorating cell Claim 2; Page 3; 19pp; English. 96US-0759599 Krystal G, Rabkin SW; WPI; 2003-246673/25 (KRYS/) KRYSTAL G. Krystal G, Rabkin SW;

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 8; Column 12; 15pp; English.

AMY25009-Y25019 are novel peptides derived from streptokinase that ameliorate cell death. The products of the invention and their encoding nucleic acids may be useful for treating diseases and conditions related to conditions and their and their and their acids may be useful for treating diseases and conditions related to adding, cellular differentiation, physical insult (e.g. physical trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin cand any other organ), viral disorders (e.g. hepattis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disease, cerebellar degenerations, and familial amyotrophic lateral disease, cerebellar degenerations, and familial amyotrophic lateral sclerosis (FALS), cardiovascular disease (e.g. atherosclerosis, myocaddal linfarction, heart failure, cardiomyopathy, myocardial creption injury, and hypertensive heart disease), immune disease (e.g. rheumatoid arthritis, systemic lupus erythematosus, insulin-dependent, disbettes mellitus, lupus, perndcious anaemia, dermatconysit, savingment, temporal arthritis, mysthenia gravis, wegener's granulomatosis, glomerulomephritis, anti-phospholigid syndrome, and autoimmune polyarthritides), a necplastic disorder (e.g. lukemia, colon, cervix, and prostate, Hodgkin's disease and inflammatory induced cell damage to the eye, brain and other nodes and inflammatory induced cell damage to the eye, brain and other organs), ischemia or reperfusion injury (e.g. myocardial ischemia and or reperfusion injury, retinal ischemia or infarction, and stroke), toxic damage to other organs from chemicals, radiation, and other noxious substances, macular colon, cararact formation, panceatitis, Crohn's disease (e.g. undernative colitis, accelerated aging, spinal cord disease (e.g. myocardial section, and demonial suchemia and organican diseases, degeneration, cataract formation of the spinal cord disease (e.g. other organians) in and second surfary chanced encoder surfaract. Corgans and encodes surfary chanced encodes and diseas and demyelinating disease), bypass surgery, chemotherapy, chemically-induced reperfusion, and therapeutics such as clozapine, AZT.

The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.

induces fibrin-dependent plasmingen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of anno acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a mucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proceolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold, The present represents recombinant streptokinase, designated rSK144-293.
                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated bacterial protein that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a peptide corresponding to amino acids 148-293 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. In is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptococcus, streptokinase, fibrin-dependent plasminogen activator, nSK; rSK; bacterial; blood clot, thrombotic condition, myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                 ptide; streptokinase; streptokinase-specific antibody; activity; thrombolytic therapy; glomerulonephritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                        Peptide corresponding to amino acids 148-293 of streptokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides which bind streptokinase-specific antibodies useful in thrombolytic therapy

Streptokinase derivative having a C-terminal deletion (i.e. pro 373-bys 414) and Arg 45 to G19 68 also being deleted. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity.
The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                  The present sequence represents a peptide corresponding to amino acids 120-352 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of streptokinase encoded by a pST-1 HindIII fragment. Recombinant streptokinase can be produced by culturing bacteria transformed with a high efficiency plasmid contg. the streptokinase gene, amplified by using haemolytic Streptococcus as the template and using inducers based on the streptokinase nucleotide sequence. The recombinant streptokinase is used to treat thrombotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

 induces fibrin-dependent plasmingen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a modified treptokinase protein; administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminosen activator is useful for a bacterial fibrin-dependent plasminosen scrivator is useful for myocardial infarction, venous thrombosis. Pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified arterptokinase can also be used in non-human mammals. Streptokinase activation of plasminosen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least on amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents recombinant streptokinase, designated rSK59-414.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

ARCC 9642.

Minal and engineered to add a Met codon prior to codon 16 of the streptokinase CDS. The construct was used to prepare expression vector pGG06 for prodh. of the streptokinase core molecule.

256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-6 and AAR10198-R10200.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and retaining streptokinase activity. One or more of the amino acids can be replaced by a different amino acid at the same position or it can be deleted. Alternatively, an extra residue can be inserted into the sequence. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in platients with lung thrombus or myocardial infarction. See also AAQ10230 and AAR10195-R10199.

                                                                                                                                                                                                  Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Phe at position 118 being deleted. Alternatively, Phe 118 can be replaced with any other amino acid. Derivatives show as decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230 and AAR10196-R10200.

Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lya 414) and Pro residues being inserted next to Lya at both positions 256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-7 and AAR10199-R10200.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the Nor C-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversation to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Streptokinase(1-372, Lys 256, Lys 257 replaced by Lys-Pro-Lys-Pro).

```
example of a streptokinase derivative which is a combination of two individually claimed modifications. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-8 and AAR10200.
                                                                                                                                                                                                                                                                                                                                                                                            Streptokinase; SKC-2; plasminogen; plasmin; antigenicity; plasminogen activator complex formation; thrombolytic; myocardial infarction; pulmonary thromboembolism; thrombosis.

                                                        Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the Nor C-terminus -
                                                                                                                                             The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptokinase derivative having a C-terminal deletion (i.e. pro 373-Lys 414) and Arg 45 to Gly 68 also being deleted. In addition Gln residues replace Lys at positions 256 and 257. This is an

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasmingen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigencity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical

The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antiartherosaleterotic, vasotropic, immunosuppressive, anti-HIV.

CC antialfarerosaleterotic, vasotropic, immunosuppressive, anti-HIV.

CC dermatological, antidiabetic, antianaemic, virucide, ophthalmological, antiulcer, antibaressitic. Peptides of the invention are useful for treating comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. harkinson's, Alzheimer's, Huntington's comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. harkinson's, Alzheimer's, Huntington's cancer, inflammatory disorders (e.g. arthritis, inflammatory joint disorders), cardiovascular diseases (e.g. heart fallure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases, acquired immunodeficiency syndrome (AlDS), rheumatorial arthritis, systemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases, viral diseases, and degeneratics, infectious diseases including bacteria, parasite, prion-based diseases, and eryancher sanding reperent sequence represents a representative

SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial inflatorion, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8X8XXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliorating cell death, its derivative or analogue, comprissing a sequence Val-Aspe-Val, where the peptide is in a suitable pharmaceutical composition a suitable pharmaceutical composition comprising the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's disease and Alzheimer's disease; cardiovascular disease e.g. AIDS and atherosclerosis and myocardial infarction; immune disease e.g. AIDS and inflammatory disorder e.g. arthritis morphastic disorders e.g. leukaemia and carcinoma; inflammatory disease caused by physical insult e.g. trauma and severe shock; ischaemia or reperfusion injury e.g. myocardial ischaemia and spinal cord capacitation injury e.g. myocardial ischaemia and spinal cord capacitation injury e.g. myocardial ischaemia and spinal cord disease e.g. nepatitis and viral encephalitis; conclusively viral disease e.g. nepatitis and viral encephalitis; infectious diseases e.g. hepatitis and viral encephalitis; or infectious diseases e.g. hepatitis and viral encephalitis; or infectious diseases e.g. hepatitis and viral encephalitis; or infectious diseases e.g. hepatitis encephalitis; crohr's disease; blooded animal. The present sequence represents the amino acid sequence of a representative streptokinase from which the cell death ameliorating peptides are produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                           The SKC-2 gene was isolated from S equisimilis type C by gene amplification from the synthetic primers SK1, SK2 and SK3 (see AAQ20666-8). The SKC-2 gene was inserted into yeast expression vector pPS-7 for extracellular expression of streptokinase and into pNAO for intracellular expression in yeast. For expression in bacteria, the SKC-2 gene was inserted in plasmid pEKG3, between a trp promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                               Streptokinase C-2 gene from S.equisimilis type C - plasmids and transformants for large scale intra- and extracellular expression of SKC-2 useful in thrombolytic agents

describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. PI is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising can mucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an carbor comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising (2) and bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in parients with a thrombosis. The modified confiction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified attention of plasminogen is at least to fold, preferably 100-fold grader in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least to fold, preferably 100-fold carboridates a substrate site for proteolytic cleavage. This reduces the interpresents native streptokinase at least two-fold. The present control protein that the presents native streptokinase at least two-fold. The present control protein at least to the control presents at least to the control present the present control presents at least two-fold. The present control presents at least two-fold. The present control presents at least two folds. The present control presents at l

The present sequence represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to haemolytic Streptococcus able to activate human plasminogen (HPlg) to hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.

The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as a cute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.
                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus equisimilis H46A; streptokinase; mutant; fibrinolytic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plasma clot; hydrolysis; haemolytic Streptococcus; plasminogen; plasmin; serine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction;

```
The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immune or system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

```
The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence or or more potential epitopes for T-cells (T-cells epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of a de-immunised SK protein molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptokinase; SK; hybrid plasminogen activator; fibrin binding region; plasminogen; human; fibronectin; thrombolytic therapy; cardiovascular disorder; fibronectin.

This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between plasminogen activator (PA) comprises a polypeptide fusion between attreptokinase (SX) which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin and fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable command or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as conditional as kinetics of plasminogen activation that are distinct from that of natural streptokinase in the natural rate of the catalytic conversion of plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after controlating blood plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after controlating blood plasmin con plasmin, thus adding in the circulating blood plasminogen activation process to the site of paranilaginal thrombus. This overcomes systemic plasminogen activation centuatered during clinical use of streptokinase.

Exproteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell cepitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the producing a protein with an enzymatic activity which has a beneficial ceffect, a protein used to convert inactive days to its active form within a living organism, a vaccine, a protein used as a carrier of other molecule or a protein which binds to other molecules within or introduced within the living organism. The less immunogenic bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic correction is useful in medicine, diagnosis and in manufacture of a protein is useful in medicine, diagnosis and in manufacture of a certain strains of beta-haemolytic streptokinase is produced by certain strains of beta-haemolytic streptokinase is produced by certain strains of beta-haemolytic streptokinase is produced by protein tain its activation to plasmin and thereby promoting the corentation of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, my morein to a single use. The new method could provide a longer coronary and preserving left ventricular function following protein to a single use. The new method could provide a longer therapeutic use for streptokinase. This is the sequence of the wild type streptokinase. The altered streptokinase sequence is given in AAB01296. See GENESEQ records AAB01289-801302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                    Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes

rectains or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive drugs to its active form within a living organism; a vaccine, a protein used as a carrier of other molecules or a protein which binds to other molecules within or introduced within the living organism; in order to alter the bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a certain strains of beta-haemolytic streptoxinase is produced by certain strains of beta-haemolytic streptoxinase is produced by contract or its ability to efficiently bind human plasminogen, or inherent enzymatic activity but has considerable clinical importance contraction of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, effective thrombolytic agent in the reatment of coronary thrombosis, improving survival and preserving left ventricular function following mycoardial infarction. The new method could provide a longer protein to a single use. The new method could provide a longer the ratered streptoxinase. This is the sequence of the altered streptoxinase. This is the sequence is given in AAB01295. See GENESEQ records AAB01289-B01302.
                                                                                                                                                                                                                                                                                                                                                                                       Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence is streptokinase, a single-peptide secretory protein which is produced by various strains of haemolytic Streptococcus. Streptokinase forms a tight binding complex with human plasminogen, causing the spontaneous conversion of plasminogen to its active form, plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Plasminogen is implicated in perioellular proteolysis associated with a wide range of physiological processes. Plasminogen activators regulate plasminogen expression either by forming a binding complex, as in the case of streptokinase, or by hydrolysing a peptide bond in plasminogen to convert it to plasmin. Review of sequence homologies of several plasminogen activators and chymotrypain has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful the inserted between maino acid residues 644 and 645 of full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       °,

Streptokinase produced using E.coli transformed with a recombinant streptokinase vector can be isolated for use as a thrombolytic agent to facilitate the in vivo lysis or dissolution of blood clots. The vector is esp. a plasmid obtd. From E.coli, esp. plasmid pBR 322. Recombinant plasmid pMF1 as defined by a restriction endonuclease map is claimed. Escherichia coli HB 101 harbouring plasmid pMF1 is depositd as ATCC 39613.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptokinase A; recombinant phage; thrombolytic agent; plasminogen; plasmin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel thrombolytic agent comprising streptokinase where at least one nonessential portion has been modified. The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the nonessential portions removed or trundated simplify the molecule. Such smaller proteins are cheaper and easier to produce. This sequence represents a fragment of a Streptococcus sp. streptokinase protein which is used in the description of the method of the invention.
                                                                                               Thrombolytic agent; streptokinase; antigenic; blood clot; heart attack;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New thrombolytic agents derived from modified humanized streptokinase, useful for treating blood clot disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 30; DB 21; Length 415; 100.0%; Pred. Infected cells are cultured in lig. medium contg. assimilable C and N sources, and streptokinase G is isolated from the cell lysate.

The infected cells provide the protein in high yields, i.e. 600 U/ml which is 1.5-2 times that for the donor strain.

The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD-276694 (AAQ05604).

(Updated on 25-MAR-2003 to correct PA field.)
           Lambda L47.1 is ligated with genomic DNA from S. pyogenes SF130/13 and the resultant product used to transform bacteria. Infected cells are cultured in liq. medium contg. assimilable C and N sources, and streptokinase A is isolated from the cell lysate. The infected cells provide the protein in high yields, i.e. 1000 U/ml compared to 80 U/m; for the donor strain. The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD-276693 (AAQ05603).

The sequence was deduced from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C ) ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). See Swiss-Prot K02986 and P00779 and Geneseq N70106. The gene can be used to construct expression ecrocis in which the streptokinase gene is linked to a second gene encoding e.g. another streptokinase protein, hirudin, or a streptokinase-like protein, via a linking sequence encoding a cleavage kinase-like protein, via a linking sequence encoding a cleavage fusion protein are present at the site of the target thrombus so the active agents are released specifically at the place where clot

                                                                         음
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antinilammatory activity. [1], nucleic acids encoding (1), ABN66044-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by creptococcus bacteria, particularly S. agalactica and S. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a composition comprising (1) or a nucleic acid encoding (1), may be consequently a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be maningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be cused in gene therapy. Antibodies to (1) are used for affinity changing antipococcus proteins.

The protein is a recombinant product of a gene fusion construct.

The sequence of the synthetic hirudin HV-1 genes was designed
assed on the published amino acid sequence (bodd J., et al FEBS
Letters 165 180 (1984).

Letters 165 180 (1984).

From Eck amplified chromosomal DNA from S. equisimilis ATCC 10009
C or ATCC 5642.

The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, Ished DNA sequence or construct an expression vector in which the hirudin gene is linked to the streptokinase gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is sequence encoding a cleavage site for factor Xa.

C released specifically at the place where clot formation is occurring. See also AAR12887-R12889, AAR12891-R12894 and AAR12522.

```
The protein is a recombinant product of a gene fusion construct.

The sequence of the synthetic hirudin HV-1 genes was designed
assed on the published amino acid sequence (bodd J., et al FBBS
Letters 165 180 (1984). The sequence of streptchinase was obtd.

From PCR amplified chromosomal DNA from S. equisimilis ATCC 10009

or ATCC 9642. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]).

Esquences were used to construct an expression vector in which the streptchinase gene is linked to the hirudin gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. See also AAR12889. ARR12891-R12894 and AAR12885.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The streptokinase sequence was obtd, from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642 (the primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Perretti, J.J., Gene 34 357-362 [1985]). The gene was fused to DNA encoding the yeast alpha factor pre-pro-secretion sequence in an expression vector, pSMD1/152, for prodn. of recombinant streptokinase in S. cerevisiae strain BJ2168 see also AAR12887-R12889. AAR12892-R12994, AAR12885 and AAR12522. (Updated on 25-MAR-2003 to correct PA field.)

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clotes. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for a bacterial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. Streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least to a emino acid substitution that confident a substitution of the streptokinase at least two-fold. The present crace of degradation of the streptokinase at least two-fold. The present crace of degradation of the streptokinase at least two-fold. The present crace of degradation of the streptokinase at least two-fold.
myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis, arterial thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 736;

composition comprision uservices an interestriction in a pharacceutical composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the modification being removal of anion acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; che expression vector comprising (1); and (4) a host cell transformed with expression vector comprising (1); and (4) a host cell transformed with a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombosic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase a streptokinase has at least one amino acid substitution that modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. The present can example of the streptokinase at least two-fold. The present sequence represents a streptokinase and maltose binding protein fusion correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated bacterial protein that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 795;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plasminogen-binding fragment; streptokinase; degradation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642. The gene was tuncated by 15 codons at the 3' terminal and one copy engineered to add a Met codon prior to codon 16 of the CDS. The two truncated genes were used to construct an expression vector in which they were linked via a sequence encoding a cleavage site for thrombin which, when cleaved, releases the individual proteins which have antithrombotic activity. The thrombin is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. The gene was used to construct an expression vector in which two streptokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fusion protein cleavage by blood clotting enzyme - for prodn. of fractions having greater antithrombotic activity for therapy and prophylaxis.
                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion protein; blood clotting; coagulation; fibrinolysis; antithrombotic; thrombolysis; major outer membrane protein A;
of streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at le 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion.

useful as thrombolytic agents in treating thrombosis and in medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment
                                                                                                                                                                                                                                                  This sequence represents the plasminogen-binding fragment of streptokinase which lacks the N-terminal 14 amino acids. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus
                                                                                                                                                                                                                                                                                                                                                                                                                                              .

This fusion protein was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.
                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical
denes are linked via a sequence encoding a cleavage site for thrombin which, when cleaved, releases the individual proteins which have anti-thrombotic activity. The thrombin is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood close in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.

This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood colots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.

                                                   This sequence represents a fusion protein between maltose-binding protein and a modified form of the plasminogen-binding fragment of streptokinase containing 6 point mutations. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 2; Column 12; 15pp; English.

AAY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

uclaid acids may be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

cond any other organ), viral disorders (e.g. hepatitis, retroviral

infections, viral encephalitis, and AID5/HIV), neurodegenerative

ci disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's

ci serceis (FALS)), cardiovascular disease (e.g. atherosclerosis,

consciential infarction, heart failure, cardiomyopathy, myocardial

creperfusion injury, and hypertensive heart disease), immune disease (e.g.

rheumatoid arthritis, systemic lugus erythematosus, insulin-dependent,

diabetes mellitus, lupus, pernicious anaemia, dermatomyositis, enythema

condosum, Sigoran's systomic lugus erythematosus, insulin-dependent,

The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprocective, antiparkinsonian, anticonvulsant, cytostatic, antinatherosclerotic, vasotropic, immunosuppressive, anti-HIV controlled, antiutidabetic, antianaemic, virucide, ophthalmological, antidabetic, antianaemic, virucide, ophthalmological, antidabetic, antianaemic, virucide, ophthalmological, antidabetic, antianaemic, virucide, ophthalmological, antidabetic, antianaemic, virucide, ophthalmological, antidaces apoptosis and antiparasitic. Peptides of the invention ameliorates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating concurration diseases (e.g. Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic disorders including cancer, inflammatory disorders (e.g. arthritis, inflammatory joint disorders (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune diseases, acquired immunodeficiency syndrome (AIDS), rheumatoid arthritis, systemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myolodegenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, crohn's diseases, ulcerative oolitis, cataracts, pancreatitis, infectious diseases, and desire. The current sequence represents a streptokinase accelerated aging. The current sequence represents a streptokinase of derived beptide of the invention with an ability to ameliorate cell Length 6; death in cardiac myocytes. 6 AA; Sequence

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

Claim 7; Column 5; 18pp; English

peptides of the invention may be described as, mostropic, concurrent convoluent, cytostatic, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antidabetic, antianaemic, virucide, ophthalmological, dermatological, antidabetic, antianaemic, virucide, ophthalmological, antidacerial and antiparasitic. Peptides of the invention ameliorates apoptosis and necrosis in a warm-blooded animal. Compositions comprising peptides of the invention are useful for treating comprising peptides of the invention neoplastic disorders including cancer, inflammatory disorders (e.g. heart failure, atherosclerosis cancer, inflammatory disorders (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune conservation injury), immune diseases, and degenerative diseases (e.g. my organ. Other disorders include macular degeneration, cataracts, conservative diseases, ulcerative colitis, cataracts pancerative diseases, ulcerative colitis, cataracts pancerative diseases. The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, diseases including bacteria, parasite, prion-based diseases, and accelerated aging. The current sequence represents a streptokinase derived peptide of the invention with an ability to ameliorate cell death in cardiac myocytes.

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 7; Column 12; 15pp; English.

AAY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

nucleic acids may be useful for treating diseases and conditions related
to aging, cellular differentiation, physical insult (e.g. physical

trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,
and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin
and any other organ), viral disorders (e.g. hepatitis, retroviral
infections, viral encephalitis, and AIDS/HV), neurodegenerative
disorders (e.g. Parkinson's disease, Altheimer's disease, Huntington's
clerosis (FALS)), cardiovascular disease (e.g. atherosclerosis,
myocardial infarction, heart failure, cardiomyopathy, myocardial
cheumatoid arthritis, systemic lupus erythematosus, immune disease (e.g.
cheumatoid arthritis, systemic lupus erythematosus, insulin-dependent,
diabetes mellitus, lupus, pernicious anaemia, dermatomyositis, enythema
nodosum, Sjogren's syndrome, temporal arthritis, myasthenia gravis,
medoener's granulomatosis, glomerulonephritis, anti-phospholipid syndrome,
and autcimmune polyarthritides), a neoplastic disorder (e.g. leukemia,
sarcomas, myelomas, neuromas, melanoma, cancers of the

New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, autiarthritic, anticonvulsant, cytostatic, antinflammatory intidiabetic, immunosuppressive, anti-HIV, contribacterial and antiparasitic. Peptides of the invention anticorder, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antianaemic, virucide, ophthalmological, antidiacer apoptosis and natiparasitic. Peptides of the invention ameliorates apoptosis and natiparasitic. Peptides of the invention accomprising peptides of the invention awarm-blooded animal. Compositions of the invention neoplastic disorders including concerning and myocardial reperfusion injury), immune diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune cy gettemic lugues erythematosus, diabetes mellitus, pernicious anaemia), myolodegenerative diseases, viral diseases, and degenerative diseases of any organ. Other disorders include macular degeneration, cataracts, myelodecentated aging. The current sequence represents a streptokinase contents in the invention with an ability to ameliorate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

```
The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliorating cell death, its derivative or analogue, comprising a sequence Val-Asp-Val, where the peptide is in a suitable paramaceutical carrier or diluent. The pharmaceutical composition composition the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's disease and Alzheimer's disease, cardiovascular disease e.g. Parkinson's disease and Alzheimer's neoplastic disorders e.g. leukseemia and carrinoma; inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and spinal cord cischaemia or reperfusion injury e.g. myocardial ischaemia and spinal cord reperfusion injury; toxic insult e.g. liver toxicity and pulmonary toxicity; spinal cord disease e.g. motor neuron disease and Guillain-Bare syndrome; procedures associated with cell death e.g. bypass surgery and chemotherapy; viral disease e.g. hepatitis and viral encephalitis; infactious diseases e.g. hepatitis and viral encephalitis; infactious diseases e.g. hepatitis and viral encephalitis; infactious diseases e.g. hepatitis and viral encephalitis; unacultar degeneration; cataract formation; pancreatitis; Crohn's disease; ulcerative colitis; accelerated aging and oxidative stress in a warm-biooded animal. The present sequence represents the amino acid sequence of a generating cell death which is based on a contractive interesting cell death which is based on a

Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

Claim 8; Column 12; 15pp; English

ANY25009-Y25019 are novel peptides derived from streptokinase that

ameliorate cell death. The products of the invention and their encoding

cnucleic acidsmay be useful for treating diseases and conditions related

to aging, cellular differentiation, physical insult (e.g. physical

trauma, anoxia, hyperthermia, hypothermia, chemically induced damage,

and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin

cn drauma to the brain, spinal cord, kidney, heart, lungs, liver,

and trauma to the brain, apinal cord, kidney, heart, lungs, liver,

and any other organ), viral disorders (e.g. hepatitis, retroviral

cn disorders (e.g. Parkinson's disease, Alzheimer's disease, liver, skin

cn disease, cerebellar degenerations, and familial amyotrophic lateral

colerosis (FALS)), cardiovascular disease (e.g. atherosclerosis,

disease, cerebellar degenerations, and familial amyotrophic lateral

sclerosis (FALS)), cardiovascular disease (e.g. atherosclerosis,

disease arthitacs, bytemic lupus erythematosus, insulin-dependent,

disease arthitus, lupus, pernacious anaemia, dermatomyositis, enythema

nodosum, Sjogren's syndrome, temporal arthitis, anti-phospholipid syndrome,

descremes, myelomas, carcinomes, pernacional arthitis, anti-phospholipid syndrome,

sarcomas, myelomas, carcinomas, and prostate, Hodgkin's disease and

condosum, sichemia or reperfusion injury (e.g. myocardial ischemia

and terperfusion injury, retinal ischemia or infarotion, and stroke), toxic

disorders and inflammatory induced cell damage to the eye, brain and

cother organs), ischemia or reperfusion injury (e.g. myocardial ischemia

and reperfusion injury, retinal ischemia or infarotion, and stroke), toxic

insult (e.g. liver toxicity, pulmonary toxicity, toxic damage to other

corgans from chemicals, radiation, and other noxious substances),

mental descention, cataract formation, pancreatitis, crown, beancher and

degeneration, cataract formation, chemotherany

and demvelination disease, home and pennylanove.

and demvelination diseas and demyelinating disease), bypass surgery, chemotherapy, chemically-induced reperfusion, and therapeutics such as clozapine, AZT, , chemotherapy and anthracyclines.

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antinflammatory, antiarthritic, anticonvulsant, cytostatic, antinflammatory, antiarthritic, anticonvulsant, cardiant, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antiparasitic. Peptides of the invention antiulcer, antibacterial and antiparasitic. Peptides of the invention comprising peptides of the invention are useful for treating neurodegenerative diseases (e.g. Parkinson's, Alzheimer's, Huntington's comprising peptides of the invention are useful for treating cancer, inflammatory disorders in inputitis, inflammatory joint disorders), cardiovascular diseases (e.g. arthritis, inflammatory joint disorders), cardiovascular diseases (e.g. arthritis, inflammatory joint disease, acquired immunodeficiency syndrome (Albs), rheumatory disorders include macular degenerative diseases of and myocardaral repertures include macular degenerative diseases of myologenerative diseases, ulcerative collitis, cataracts, panoreatitis, infectious diseases including bacteria, parasite, prion-based diseases, and
                                                                                                                                                                                                                       Streptokinase, cell death, apoptosis, necrosis, nootropic, neurogrotective; antiparkinsonian; anticonvulsant; cytostatic; neurogrotective; antiparkinsonian; anticonvulsant; cytostatic; antiatherosclerotic; vasotropic; immunosuppressive; anti-HIV; dermatological; antidabetic; immunosuppressive; anti-HIV; antiulcer; antibacterial; antiparasitic; neurodegenerative disease; wartiulcer; antibacterial; antiparasitic; neurodegenerative disease; werebellar degeneration; neoplastic disorder; cancer; inflammatory disorder; arthritis; inflammatory joint disorder; wardiovascular disease; heart failure; atherosclerosis; myocardial reperfusion injury; immune disease; autoimmune disease; acquired immunodeficiency syndrome; AIDS; theumatorid arthritis; acquired immunodeficiency syndrome; AIDS; theumatorid arthritis; was systemic lupus erythematosus; diabetes mellitus; pernicious anaemia; myelodegenerative diseases; viral diseases; macular degeneration;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cataract; Crohn's disease; ulcerative colitis; pancreatitis;

The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a diministering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for a bacterial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase streptokinase has at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This present care of degradation of the streptokinase at least two-fold. The present sequence represents recombinant streptokinase, designated rSK144-293.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigenic peptide, streptokinase, streptokinase-specific antibody, thrombolytic activity, thrombolytic therapy, glomerulonephritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide corresponding to amino acids 120-352 of streptokinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a peptide corresponding to amino acids 148-293 of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptococcus; streptokinase; fibrin-dependent plasminogen activator; nSK; rSK; bacterial; blood clot; thrombotic condition; myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis.

                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                               The present sequence represents a peptide corresponding to amino acids 120-352 of streptokinase. The specification describes a polypeptide which binds to a streptokinase pecific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of streptokinase encoded by a pST-1 HindIII fragment. Recombinant streptokinase can be produced by culturing bacteria transformed with a high efficiency plasmid contg. the streptokinase gene, amplified by using haemolytic Streptococcus as the template and using inducers based on the streptokinase nucleotide sequence. The recombinant streptokinase is used to treat thrombotic
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity.
The protein is used as a thrombolytic agent in patients with lung thromboly is myocardial infarction. See also AAQ10230, AAR10195 and AAR10197-R10200.

```
The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C) ATCC 10009 or ATCC 9642.

ATCC 9642.

The gene was truncated by 15 codons at the 3' terminal and engineered to add a Met codon prior to codon 16 of the streptokinase CDS. The construct was used to prepare expression vector p6G606 for prodn. of the streptokinase core molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clotes. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a florin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; capterial fibrin-dependent plasminogen activator is useful for the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thromboois. The modified tromboois, graft thrombosis and arterial thromboois. The modified activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present condition of sequence represents recombinant streptokinase, designated rSK59-414.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-6 and AAR10198-R10200.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-lys 414) and retaining streptokinase activity. One or more of the amino acids can be replaced by a different amino acid at the same position or it can be deleted Alternatively, an extra residue can be inserted into the sequence. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in Secondary and ARR10195-R10199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic gene encoding streptokinase - scale, high purity prodn. of streptokinase used as a thrombolytic agent
                                                                                                                       Length 372;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 372;

                                                                                                                                                                                                                               Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Phe at position 118 being deleted Alternatively, Phe 118 can be replaced with any other amino acid. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in several activity and specificity. The prefer is used as a thrombolytic agent in selectivity and specificity. The prefer with lung thrombus or myocardial infarction.

Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lyg 414) and Pro residues being inserted next to Lyg at both positions 256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AQ10230, AAR10195-7 and AAR10199-R10200.
                                                                                                                                                                                                                                                                                     Synthetic gene encoding streptokinase - scale, high purity prodn.
of streptokinase used as a thrombolytic agent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigencity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolyvic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolyvic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptokinase derivative having a C-terminal deletion (i.e. pro 373-Lys 414) and Arg 45 to Gly 68 also being deleted. Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the pill-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for
                                                                                                                                                                                                              Gaps

example of a streptokinase derivative which is a comb individually claimed modifications. Derivatives show a decreased antiqenicity, higher stability in blaclectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in parlents with lung thrombus or myocardial infarction. See also AAQ10230, AAR10195-8 and AAR10200.

The products of the invention and their encoding nucleic acids may be useful for treating diseases and conditions related to aging, cellular differentiation, physical insult (e.g. physical trauma, anoxia, hyperthermia, hypothermia, chemically induced damage, and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin and any other organ), viral disorders (e.g. hepatitis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disorders (e.g. harkinson's disease, Runtington's disease, cerebellar degenerations, and familial amyotrophic lateral sclerosis (FALS)), cardiovagoular disease (e.g. atherosclerosis, myocardial infarction, heart failure, cardiomyopathy, myocardial

SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.

```

The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antimiflammatory, antiparkinsonian, anticonvulsant, cytostatic, antimiflammatory, antiparkinsonian, anticonvulsant, cytostatic, cantiatheroselerotic, vasotropic, immunosuppressive, anti-HIV, dermatological, antidiabetic, antianaemic, virucide, ophthalmological, antidiabetic, antimanemic, virucide, ophthalmological, antidiabetic, antimanemic, virucide, ophthalmological, antidiabetic, antiparasitic. Peptides of the invention are useful for treating comprising peptides of the invention are useful for treating controlled of seases (e.g. harkinson's, Alzheimer's, Huntington's disease and cerebellar deseneration) neoplastic disorders including cancer, inflammatory disorders (e.g. arkinists, inflammatory joint disorders), cardiovascular diseases (e.g. heart failure, atheroselerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune confisease, acquired immunodeficiancy syndrome (ALDS), rheumatoid arthritis, systemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases, uncerative, colitis, cataracte, pancreatitis, infectious diseases including bacteria, parasite, prion-based diseases, and ergenerative colitis, cataractes, and ergenerative sequence representative

The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliorating cell death, its derivative or analogue, comprising a sequence Val-App-Val, where the peptide is in a suitable pharmaceutical carrier or dibuent. The pharmaceutical composition (comprising the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's disease and Alzheimer's disease; cardiovascular disease e.g. AIDS and therosclerosis and myocardial infarction; immune disease e.g. AIDS and creumatory disorder e.g. arthritis and inflammatory induced cell camage; inflammatory disorder e.g. arthritis and inflammatory induced cell camage; disease caused by physical insult e.g. trauma and severe shock; inflammatory disorder e.g. arthritis and inflammatory induced cell camage; disease caused by physical insult e.g. trauma and severe shock; is chaemia or reperfusion injury e.g. myocardial ischaemia and spinal cord creperfusion injury; toxic insult e.g. inver toxicity and pulmonary toxicity; spinal cord disease e.g. motor neuron disease and Guillain-Bare confencious diseases e.g. bepatitis and viral encephalitis; chematherapy; viral disease e.g. hepatitis and viral encephalitis; chematherapy; viral disease e.g. hepatitis and viral encephalitis; confencious diseases e.g. becterial disease and prion-based disease; macular degeneration; cataract formation; pancreatitis; Crohn's disease; macular degeneration; cataract formation; pancreatitis; Crohn's disease. C. demochemal. The present sequence represents the amino acid sequence of a representative colitis; accelerated aging and oxidative stress in a warm-colocoded animal. The present sequence represents the amino acid sequence core peptides are produced.
